Let x be the vector position. Since velocity is constant, we have :

$$\frac{d\vec{x}}{dt} = c\vec{\tau}(\theta),$$

with $\vec{\tau}(\theta) = (\cos \theta, \sin \theta)$.

The angle θ of the vector speed is modelled as a jump process :

$$\theta(t) = \sum_{i=1}^{N(t)} S_i,$$

with N(t) a Poisson process of intensity λ and S_i independent jumps.

We note κ the curvature. The model proposed is :

 $\kappa_{n+1} = \kappa_n - \alpha \kappa_n + \varepsilon_n$

where ε_n is a random noise independent of κ_n .

Continuous version of the model :

 $d\kappa = -a\kappa dt + bdW_t.$

In the field of probability, this equation is known as the Ornstein-Uhlenbeck process.

Macroscopic model of PTW

Probabilistic method

Kinetic method

Particles in interactions

Vicsek model Kinetic equation

Summary of the probabilistic method :

- Explicit expression for the mean square displacement.
- Linear growth of the mean square displacement which indicates diffusive behavior.

However :

- No rigorous proof of diffusive behavior asymptotically.
- If we put interaction terms in the PTW model, the method is not available.

Individual displacement in biology: a new model for fish behavior

Sébastien Motsch

Models of displacement in biology Classical model Experiments Model PTW

Macroscopic model of PTW

Probabilistic method

Kinetic method

Particles in interactions

Kinetic method

We start from our PTW model :

$$\begin{array}{lll} \displaystyle \frac{d\vec{x}}{dt} &=& \vec{\tau}(\theta) \\ \displaystyle \frac{d\theta}{dt} &=& \kappa \\ \displaystyle d\kappa &=& -\kappa \, dt + \sqrt{2}\alpha \, dW_t \end{array}$$

We introduce $f(t, x, \theta, \kappa)$ the density distribution of particles.

Kinetic method

We start from our PTW model :

$$\begin{aligned} \frac{d\vec{x}}{dt} &= \vec{\tau}(\theta) \\ \frac{d\theta}{dt} &= \kappa \\ d\kappa &= -\kappa \, dt + \sqrt{2}\alpha \, dW_t \end{aligned}$$

We introduce $f(t, x, \theta, \kappa)$ the density distribution of particles.

Individual dynamics can be translated on *f* using Kolmogorov (*forward*) equation :

 $\partial_t f + \vec{\tau} \cdot \nabla_{\vec{x}} f + \kappa \partial_\theta f - \partial_\kappa (\kappa f) - \alpha^2 \partial_{\kappa^2} f = 0.$
